

Check to see if poetry is installed:

```
–poetry version
```

If not installed:

```
pip install poetry
```

Go to root directory:

```
../aviation-backend/
```

Install dependencies:

```
poetry install
```

Create an .env

```
#mac/linux:
```

```
touch .env
```

```
#windows
```

```
type nul > .env
```

Postgres database is required

If needed install at:

[PostgreSQL: Windows installers](#)

Different for linux and mac

Add postgres to path

Make a database

```
psql -U postgres
```

Run but change and <> to your own:

```
CREATE DATABASE <myapp_db>;
```

```
CREATE USER <myapp_user> WITH PASSWORD '<myapp_password>';
```

```
GRANT ALL PRIVILEGES ON DATABASE <myapp_db> TO <myapp_user>;
```

In some cases you may need to add your user as the db owner

(While in postgres cli)

```
\c <myapp_db>
```

```
GRANT ALL ON SCHEMA public TO <myapp_user>;
```

```
ALTER SCHEMA public OWNER TO <myapp_user>;
```

Open .env configure with these:

```
# Django
```

```
SECRET_KEY=dev-secret-key
```

```
DEBUG=True
```

```
# PostgreSQL
```

```
DB_NAME=<myapp_db>
```

```
DB_USER=<myapp_user>
```

```
DB_PASSWORD=<myapp_password>
DB_HOST=localhost
DB_PORT=5432
```

****dev-secret can be anything**

****Debug needs to be true**

****DB stuff is all dependent on your psql commands above**

****Host and port are fixed**

Apply database migrations

```
poetry run python manage.py migrate
```

Add django superuser:

```
poetry run python manage.py createsuperuser
```

****remember login info**

Run the server:

```
poetry run python manage.py runserver
```

Go to website:

127.0.0.1:8000/admin

Sign in with super user details
